

C++ Programming

ECTS : 3

Description du contenu de l'enseignement :

This practical oriented course focuses on learning C++ language as a practical tool. It aims to be both an introduction to C/C++ and a basic course for whoever want to get an expertise in programming. A special care to practice is taken through solving simple issues C++ as a tool ; no special programming background is expected. The 2 last courses are dedicated to advanced topics, not mandatory to learn the language, but important for people with programming background especially C programmers. A good grasp of the previous lessons will be required.

Course outline:

1. The basics

- Working with git
- C++ first program, compilation chaintools, input and output
- Variables and types, scopes, operators
- Working with numbers: maths VS computers
- Control structures

2. Express your algorithms using C++

- Functions (declaration, arguments, overloading)
- lvalue and rvalue references
- Namespace
- Precompiler and macros
- Program structure and build process
- Application: closed-formulae for pricing

3. Programming with the STL

- Sequential containers
- Associative containers
- Algorithms, iterators, functors
- Lambdas
- Streams

4. Defining your own types

- Structures and classes
- Value semantic
- Conversions
- Operator overloading
- Application: data models in pricing libraries

5. Managing memory and low-level data structures

- Pointers and arrays
- Pointer to method and functions
- Three kinds of memory
- Exceptions

6. Making your types abstract

- Inheritance and polymorphism
- Entity semantic and Liskov Substitution Principle
- Runtime Type Information
- Multiple inheritance
- Inheritance of implementation
- Application: reusable numerical tools

7. Generic programming: write less, do more
- Template classes and specializations
 - Template functions, specialization vs overloading
 - Type deduction and auto
 - Universal references and perfect forwarding
 - Curiously Recurring Template Pattern
 - Traits
 - Managing the overload resolution set
 - Variadic templates and advanced metaprogramming

Compétence à acquérir :

Knowledge in C++ programming for finance

Bibliographie, lectures recommandées :

Beginners:

Stanley B.Lippman, Josee Lajoie, Barbara Moo, "C++ Primer ", Fifth Edition, 2012.

Koenig A. & B. E. Moo, "Accelerated C++", Addison-Wesley, 2000

Reference guides:

Bjarne Stroustrup, "The C++ Programming Language", Fourth Edition, 2013.

Nicolai M. Josuttis N. M., "The C++ standard library" 2nd edition, Addison-Wesley, 2012

Scott Meyers, "Effective STL", Addison-Wesley, 2001
